Carefully selected parts allows our stove fan start operate within 1 min., when stove surface heats up to 50°C.

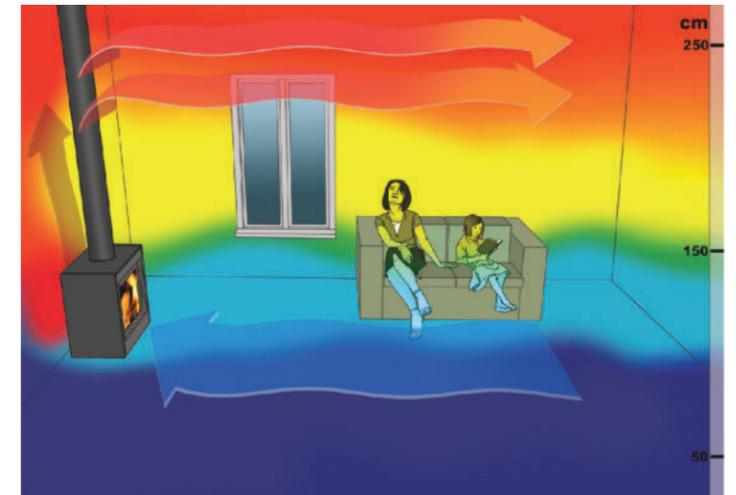

Our engineers team created special design blades, which allows to reach up to 350 m³ per hour airflow.

And this airflow allows to heat up room up to 30% faster.

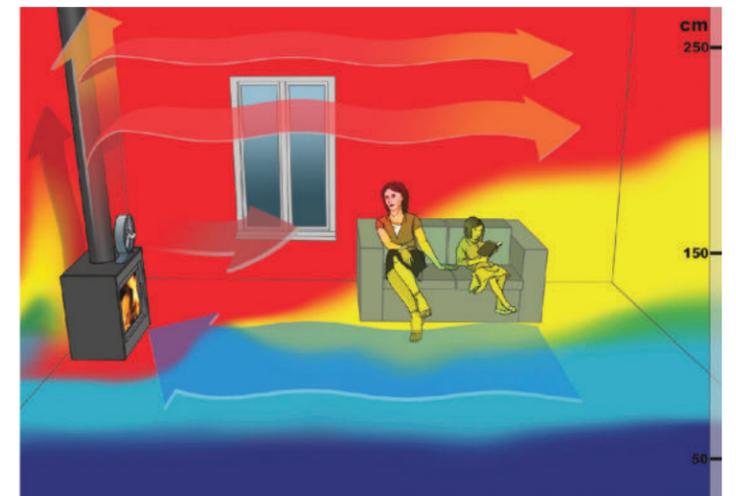

And as a consequence of that you will use up to 20 % less fuel. Trees will thank you for that!

Heavy base of fan are able to accumulate energy and because of that fan will operate up to one hour after end of burning.

Did you know that SIROCCO are really universal fan? If you buy just fan you can use it on top of the stove; if you add vertical mounting kit - fan hang on fireplace doors; and if you add flue pipe bracket fan will reach up to 3 times more heat circulation!

Air circulation without SIROCCO

Air circulation with SIROCCO

P.S. With adjustable screw legs SIROCCO can be used on uneven surface or oblique stoves.
